Introduction

In this project you will learn how to create a game in which you have to save the Earth from space monsters.

What you will make

Score as many points as you can by shooting flying space-hippos. If you get hit by a hippo or by an orange dropped by the bats, you lose a life.

What you will need

Hardware

- A computer capable of running Scratch 3

Software

- Scratch 3 (either online or offline)

What you will learn

- How to make sprites move using keyboard input
- How to clone sprites to make copies of them
- How to use ‘broadcast' and ‘receive blocks' to send messages
Step 1: Make a spaceship

First make a spaceship that can defend the Earth!

✅ Activity Checklist

- Open the 'Clone wars' Scratch starter project.
  - **Online:** open the starter project at [rpf.io/clone-wars-on](rpf.io/clone-wars-on).
    If you have a Scratch account you can make a copy by clicking **Remix**.
  - **Offline:** download the starter project from [rpf.io/p/en/clone-wars-go](rpf.io/p/en/clone-wars-go), and then open it using the offline editor.
    If you need to download and install the Scratch offline editor, you can find it at [rpf.io/scratchoff](rpf.io/scratchoff).

Add this code to the **spaceship** sprite to make the spaceship move left if the **left** arrow is pressed:

```scratch
when green flag clicked
forever
  if key left arrow down pressed then
    change x by -4
end
```

The x-axis goes from the left side of the Stage to the right side. This means that the spaceship moves to the left when you subtract from the value of the spaceship sprite’s **x** position. So this code block is the part that makes your spaceship move left:

```scratch
change x by -4
```
Now you are going to give the spaceship the ability to fire lightning bolts!

Here is the code you need to add below the other code inside the `forever` block:

```plaintext
if key right arrow pressed then
  change x by 4
```

Test your project by clicking the green flag. Can you press the arrow keys to make your spaceship move left and right?

Step 2: Lightning bolts

Now you are going to give the spaceship the ability to fire lightning bolts!

Activity Checklist

- Add the `Lightning` sprite from the Scratch library.
- When the game starts, the `Lightning` sprite should be hidden until the spaceship fires its laser cannons.
  
  Add this code to the `Lightning` sprite:
  ```plaintext
  when [clicked] do hide
  ```

  At the moment, the lightning bolt is really big compared to the spaceship!

  Below the code that the `Lightning` sprite already has, add some blocks to make the sprite smaller and to turn it upside down.
  ```plaintext
  set size to 25%
  point in direction -90
  ```

  Now it looks like it fires pointy end–first out of the spaceship.

- Add some new code to the `Spaceship` sprite to create a new clone of the lightning bolt if the `space` key is pressed.
What happens if you hold down the space key? Can you use a wait block to fix this?

Now you’re going to add lots of flying hippos that try to destroy your spaceship.

**Challenge: improve the lightning**

What happens if you hold down the space key? Can you use a wait block to fix this?

**Step 3: Space-hippos**

Now you’re going to add lots of flying hippos that try to destroy your spaceship.
Create a new sprite with the 'Hippo1' image in the Scratch library. Use the **shrink** tool to make the **Hippo** sprite a similar size to the **Spaceship** sprite.

Set the **Hippo** sprite’s rotation style to **left-right**.

Add some code to hide the **Hippo** sprite when the game starts.

Add some code to the Stage to create a new **Hippo** clone every few seconds. This is what your code should look like:

```
when flag clicked
hide
```

Add some code to the **Hippo** sprite to create a new clone every few seconds. When each **Hippo** clone starts, pick a random speed and starting place for it.

```
when flag clicked
forever
    wait pick random 2 to 4 secs
    create clone of Hippo1
```

Each new hippo clone should appear at a random position, and every clone should have a random speed.

Create a new variable called **speed** that is for the **Hippo** sprite only. When you've done this correctly, the variable has the name of the sprite next to it, like this:

```
Hippo1: speed 0
```

When each **Hippo** clone starts, pick a random speed and starting place for it. Then show the clone on the screen.
At the moment the hippos don't move.

Each hippo should move around randomly until it gets hit by a lightning bolt. To make that happen, attach this code below the blocks that are already in the Hippos sprite's code script:

Test your code again. You should see a new hippo clone appear every few seconds, and each clone should move at a different speed.

Now test the spaceship's laser cannon. If a lightning bolt hits a hippo, does the hippo vanish?

**Step 4: Spaceship explosion**

When a hippo touches your spaceship, the spaceship should explode!

**Activity Checklist**

- Select the Spaceship sprite and rename its costume 'normal'.
Draw another costume of an exploding spaceship, and call the new costume 'hit'.

If you don't want to draw the explosion, you can select the 'Sun' costume from the Scratch library, and then use the **Color a shape** tool to change the costume's colour and face.

Add some code to your **Spaceship** sprite so that it displays the 'normal' costume when the game starts, and switches to the 'hit' costume when it touches a hippo:

Test your code. Make the spaceship collide with a hippo. Does the spaceship change to the 'hit' costume?
Step 5: Hippos that disappear

When the spaceship explodes, all the hippos should disappear so that players of the game can recover.

✔️ Activity Checklist

☐ Add code to the spaceship sprite to make it broadcast the message "hit" when the spaceship touches a hippo.

All of the hippo sprite clones will receive the "hit" message, and you can instruct them to disappear when the spaceship is hit by adding this code to the hippo sprite:

☐ To check whether the new code works, click the green flag and make the spaceship collide with a hippo.

After the spaceship explodes, new hippo clones appear, but the spaceship is still exploded! The spaceship needs to reset itself after being hit.

☐ Add a wait block at the end of the spaceship sprite’s code to create a small pause before hippos begin appearing again. Then add a forever block around all of your code to make the code run repeatedly.
At the moment, you can play the game forever, but it doesn't count how many hippos you shoot or how many times your spaceship explodes. Can you add lives, a score, or even a highscore to your game?

Challenge: lives and score

At the moment, you can play the game forever, but it doesn't count how many hippos you shoot or how many times your spaceship explodes. Can you add lives, a score, or even a highscore to your game?

Step 5: Space-bat

To make your game a bit harder, you are going to create a bat that throws oranges at the spaceship.

Activity Checklist

Add a Bat sprite and set its rotation style to left–right.
Make the Sprite **move** from left to right at the top of the Stage forever.

Remember to test your code.

If you look at the bat's costumes, you can see that it has four different ones:

Use the **next costume** block to make the bat flap its wings as it moves.

You code should look like this:
Now make the bat throw oranges!

Add an Orange sprite from the Scratch library.

Add code to your bat so that when the flag is clicked, the Bat sprite forever waits for a random length of time between 5 to 10 seconds and then creates a clone of the Orange sprite.

Add code to the Orange to make each of its clone drop, starting from the Bat sprite and falling towards the bottom of the Stage.

Add some more code to the Orange sprite so that when an Orange clone hits the Spaceship sprite, the clone also disappears to give the player a chance to reset.
Modify the code of your Spaceship sprite so that the sprite is "hit" when it touches a Hippo sprite or an Orange sprite:

Test your game. What happens if the spaceship gets hit by a falling orange?

Step 6: Game over

Next, you're going to add a 'game over' message at the end of the game.

Activity Checklist

If you haven't already, create a new variable called lives. Your spaceship should start with three lives and lose a life whenever it touches a hippo or an orange. Your game should stop when the lives run out.

Draw a new sprite called Game Over using the text tool.

On the Stage, broadcast a game over message just before the game ends.

Add this code to your Game Over sprite so that it shows at the end of the game:

Because you've used a broadcast (game over) and wait block on your Stage, the Stage will wait for the Game Over sprite to be displayed before ending the game.

Test your game. How many points can you score? If the game is too easy or too hard, can you think of ways to improve it?
Challenge: improve your game

What improvements can you make to your game?
Here are some ideas:

- Add health packs that you can collect to gain extra lives.

- Add floating rocks that your spaceship must avoid.

- Make more enemies appear when your score gets to 100.
